

JIRA ENTERPRISE SOFTWARE & SERVICE MANAGEMENT GUIDE

Official Enterprise Operations & Agile Administration Standard

SECTION 1.0 JIRA ARCHITECTURE AND PROJECT SETUP

Jira is structured around hierarchical entities: Instances, Projects, Boards, Issues, and Sub-tasks.

Enterprise teams must adhere to company-wide naming conventions for Projects (e.g., TEAM-YYYY-PROJ).

Project Administrators are responsible for configuring issue types, components, versions, and custom field contexts.

Company-managed projects use shared global permission and notification schemes, whereas team-managed projects allow local custom configurations.

SECTION 2.0 AGILE SCRUM AND KANBAN METHODOLOGY

Jira Software provides dedicated Scrum and Kanban board templates.

Scrum boards are configured with a defined sprint cadence (standard 2-week iteration). Sprints must begin with a Sprint Planning ceremony and Story Point estimation using the Fibonacci sequence (1, 2, 3, 5, 8, 13).

Kanban boards emphasize continuous delivery and require Work-In-Progress (WIP) limits configured on each column (e.g., In Progress limit = 3 per engineer) to prevent bottlenecking.

SECTION 3.0 JIRA QUERY LANGUAGE (JQL) SPECIFICATION

JQL enables advanced searching and reporting across all indexed issues.

Key operators include '=', '!=', 'IN', 'NOT IN', '~' (text search), 'WAS', and 'CHANGED'.

Example JQL queries for compliance audits:

```
- Critical unassigned bugs: `project = 'PROD' AND issuetype = 'Bug' AND priority = 'Highest' AND assignee is EMPTY`  
  
- Overdue SLA items: `project = 'ITSM' AND statusCategory != 'Done' AND 'Time to resolution' = breached()`  
  
- Closed in current sprint: `project = 'ENG' AND sprint in openSprints() AND status = 'Closed' ORDER BY updated DESC`
```

SECTION 4.0 WORKFLOWS, STATUSES, AND PERMISSION SCHEMES

Jira workflows represent the lifecycle of an issue from creation to completion.

Standard Enterprise Workflow states: 1. Backlog -> 2. In Analysis -> 3. In Development -> 4. Code Review -> 5. QA Verification -> 6. Deployed/Closed.

Transitions must enforce Conditions, Validators, and Post-Functions:

- Validator: Pull request link must be attached before moving to 'Code Review'.
- Post-Function: Automatically assign the issue to the Reporter when status transitions to 'QA Rejected'.

Permission schemes control access levels: Browse Projects, Create Issues, Edit Issues, Assign Issues, and Administer Projects.

SECTION 5.0 JIRA SERVICE DESK AND SLA MANAGEMENT

Jira Service Management (JSM) handles IT support tickets, incident response, and change requests.

Service Level Agreements (SLAs) track operational compliance with time-based goals:

- Time to first response: Priority 1 (P1) < 15 minutes, Priority 2 (P2) < 1 hour, Priority 3 (P3) < 4 hours.
- Time to resolution: P1 < 2 hours, P2 < 8 hours, P3 < 48 hours.

SLAs pause during statuses 'Waiting on Customer' and resume upon customer reply.

SECTION 6.0 REST API INTEGRATION AND AUTOMATION RULES

Jira REST API v3 provides endpoints for automation and enterprise tool integration.

Base URL: `https://jira.enterprise.local/rest/api/3/`

Authentication: HTTP Basic Authentication using API Tokens generated from user account settings.

Common endpoints:

- `POST /rest/api/3/issue`: Create new issue with JSON payload containing fields (project, summary, description, issuetype).
- `GET /rest/api/3/search?jql={query}`: Execute JQL search and return paginated issue results.
- `POST /rest/api/3/issue/{issueIdOrKey}/transitions`: Execute a workflow status transition.
